Project Title: Auto Ticket Classification using Flow Designer

1. Introduction

Project Title: Auto Ticket Classification using Flow Designer.

Team ID: SWTID-2026-3593.

Team Members: Not specified in the supplied project documentation.

2. Project Overview

Purpose: Automate school IT helpdesk ticket classification, reduce manual effort for IT agents, and improve ticket routing efficiency.

Features: Keyword-based classification, automatic Category and Subcategory assignment, dependent Category/Subcategory choices, automated caller email notification, structured ticket records, testing, and update-set deployment.

3. Architecture

Platform: ServiceNow.

Data Layer: Custom Incident Workflow table containing Number, Caller, Category, Subcategory, Short Description, Description, State, Assigned Group, and Assigned To fields.

Automation Layer: Flow Designer using a Record Created trigger, conditional keyword checks, Update Record actions, and a Send Email action.

4. Setup Instructions

Create the Project Update Set and make it the current update set.

Create the Incident Workflow custom table and configure the required fields.

Add Category, Subcategory, and State choices.

Configure Subcategory as dependent on Category.

Create the Auto Classify School IT Tickets flow.

Configure the Record Created trigger, classification conditions, update actions, and email notification.

Activate the flow.

5. Folder Structure

Not applicable. The supplied project is a ServiceNow configuration and Flow Designer solution rather than a source-code project with client/server folders.

6. Running the Application

The solution runs inside the ServiceNow environment. When a new ticket is created and Category is empty, Flow Designer evaluates the Short Description and automatically assigns the appropriate Category and Subcategory.

7. API Documentation

No backend or external API endpoints are specified in the supplied project documentation.

8. Authentication

The supplied project documentation does not specify a separate authentication implementation. It does document security and access-control validation as part of testing.

9. User Interface

Users enter the Caller and Short Description in the ServiceNow ticket form. Category and Subcategory are automatically populated by the Flow Designer automation.

10. Testing

Test Scenario 1: “WiFi not working in library” automatically produces Category = Network and Subcategory = WiFi, with an email sent to the caller.

Test Scenario 2: “Projector not turning on” automatically produces Category = Hardware and Subcategory = Projector, with an email sent to the caller.

Validation checks include mandatory fields, unique auto-number generation, accurate Category and Subcategory values, and correct reference-field resolution.

11. Screenshots or Demo

The supplied project PDF contains screenshots of table creation, field configuration, dependent choices, Flow Designer configuration, email action, testing, and deployment.

12. Known Issues

No specific unresolved bugs or issues are identified in the supplied project documentation.

13. Future Enhancements

The project documentation identifies assignment automation, SLA tracking, and predictive intelligence as possible future extensions.
