

Project Design Phase
Proposed Solution Template

Date	03 October 2026
Team ID	SWTID-2026-3593
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	The school IT helpdesk receives multiple incident requests from students and teachers for issues such as Wi-Fi, projector failures, password problems, and slow computers. IT staff currently review and categorize these requests manually, which is time-consuming, error-prone, and inefficient. The solution automates ticket classification using ServiceNow Flow Designer by analyzing keywords in the short description and assigning the appropriate Category and Subcategory.
2	Idea / Solution description	A student enters the Caller Name and Short Description. When the ticket is created, Flow Designer checks the short description for predefined keywords and automatically updates the ticket. WiFi/Network is classified as Network → Wi-Fi; Projector as Hardware → Projector; Password/Login as Access → Forgot Password; and Slow/Hanging as Performance → Slow Computer. After classification, an automated email is sent to the caller confirming ticket creation.
3	Novelty / Uniqueness	The solution uses a no-code Flow Designer implementation with dependent Category and Subcategory choice fields. It combines automatic keyword-based classification, structured ticket fields, dependent choices, and automated email notification. The project document specifically describes the solution as easy to maintain, scalable, and completely no-code.
4	Social Impact / Customer Satisfaction	The solution reduces manual effort for IT staff, improves ticket routing efficiency, provides consistent classification, reduces human error, and sends immediate ticket confirmation to the caller. The project is designed for school IT helpdesks and is intended to improve response efficiency and communication for students and teachers.

5	Business Model (Revenue Model)	The project document does not specify a revenue model. It presents the solution as an IT helpdesk automation system for educational institutions, implemented using ServiceNow Flow Designer.
6	Scalability of the Solution	The solution is designed to be scalable and maintainable. The project document states that it is suitable for small to medium educational environments and can be extended in the future with features such as assignment automation, SLA tracking, or predictive intelligence. The use of a no-code Flow Designer approach also supports easier maintenance and future changes.
